The response to the First Edition of this text confirmed our belief that there was a need for a book of this kind. The multi-authored approach has been retained, ensuring that authoritative, current information is incorporated into each chapter and that references are up-to-date. The section on diseases of the vagina has been enhanced by a greater emphasis on the clinical aspects. The chapter on DES induced lesions has been updated with the data of the DeSAD study and the section on adenocarcinoma of the cervix has been enlarged by the description of the undifferentiated lesions including "glassy cell and signet cell" carcinoma. A departure from the traditional chapter approach has been made in the discussion of endometrial hyperplasia and carcinoma in order to present a conceptual view of these diseases. A similar presentation of diseases of the myometrium has been made. The subjects of lymphomas and mesenchymal tumors of the ovary have been enlarged upon and presented in a separate chapter. Fine needle aspiration in the diagnosis of ovarian tumors and of non malignant disorders of the ovary has become an increasingly useful technique. Two new chapters have been added to cover this subject. Many of the changes made in the second edition were in response to reviewers of the First Edition. It is hoped that their constructive suggestions have been addressed. Ancel Blaustein, M.D.

New edition includes more than 350 new illustrations and 22 revised chapters Written by internationally recognized experts Each entry is structured the same way, from general to more specific information, which allows the reader to quickly access key information in every chapter Since the publication of the 1/e in 1977, Blaustein's Pathology of the Female Genital Tract has consolidated its position as the leading textbook of gynecological pathology. Thoroughly revised and updated to bring you state-of-the-art assistance in diagnosing pathologies of the female reproductive tract. It covers more than 1100 common, rare, benign, and malignant lesions, and tackles the questions so often asked and not answered elsewhere. All entities are illustrated by well-chosen photographs of outstanding quality. The updated text provides the latest advances in immunohistochemistry, molecular biology, and cytogenetics, as well as the most current concepts, classification and staging systems for all diseases and disorders of the female genital tract. "Road maps" at the beginning of each chapter help you navigate the book more quickly. Integrates histopathologic features with data from ancillary techniques such as immunohistochemistry and cytogenetics and discussions of the relevant clinical manifestations of gynecological diseases.

In covering the topic of gynecologic and obstetric pathology, this book attempts to carve out its own niche midway between an atlas and a traditional textbook. The gross and microscopic images in this atlas are presented exclusively in color, and are supplemented by pertinent clinical information and discussions of differential diagnostic considerations. When deemed appropriate, images of immunohistochemical and special stains are included. To further enhance their visual appeal and the overall learning experience, many images in this book are presented with annotations and/or in composite form, and selected images have been enlarged. This image-intensive textbook also includes numerous Pap smear images and cytologic-histologic correlations. In addition to coverage of pathology of the organs of the female genital tract, brief overviews of the normal histology of these sites are provided as necessary background information. Separate chapters are also devoted to placental and peritoneal pathology. There is an emphasis on diagnostic-related issues pertaining to common lesions and their variants, although classic forms of rare lesions are also presented. In selected instances, recommendations on the processing of gross pathology specimens, discussions regarding the optimal approach for intraoperative consultations, and recommendations on the phrasing of key portions of pathology reports are provided. The 10 chapters of this book are organized by site, and the beginning of each chapter lists the entities discussed and their corresponding page numbers.

The core of this classic text remains its comprehensive survey of benign, precancerous, and malignant lesions. The fourth edition incorporates the latest classification schema, including the revised FIGO tumor staging systems, the Bethesda System for cervical cytology, and revised WHO and ISGYP histological classifications.

A logical approach to formulating a pathologic diagnosis from the diverse array of tissue received in the surgical pathology laboratory. The authors are both prominent gynaecologic pathologists, and this book is the result of their long-running Short Course presented at the International Academy of Pathology. Illustrations show typical artefacts and distortion and explain their impact on diagnostic interpretation, and each chapter includes a section on "Clinical Queries and Reporting" that summarises the features to be discussed in the final pathology report. Here is a strongly didactic approach to one of the most frequently ordered pathological examinations. You find superb illustrations on virtually every page and fast answers to everyday questions since emphasis is placed on clinically relevant material: commonly encountered specimens, common problems and common diagnostic issues.

This comprehensive text provides a much-needed review of a disease that is currently garnering the interest of molecular biologists, translational scientists, and clinicians. The volume includes emerging developments in the molecular genetics of endometrial carcinoma. In addition to covering the basic genetics of endometrial carcinoma, chapters also cover a wide range of signaling pathways implicated in endometrial carcinoma. A section of the book includes a number of genetically engineered mouse models, which contribute to understanding the role of various genetic alterations in the development and progression of endometrial carcinoma. These models also provide preclinical models for developing effective targeted therapeutic approaches. Endometrial carcinoma is the most common malignancy of the female genital tract in the United States and the number of cases continues to increase around the world. This book is a meant to serve as a resource for a wide range of scientists, from molecular geneticists to signal transduction biologists, as well as to both clinicians and scientists interested in developing targeted therapeutic approaches for women with endometrial carcinoma.
